omega = 0.2                  * initial omega

```

NOTE: By changing the treefile read by codeml, you are changing among "branch models" represented within the different treefiles shown below. Remember that these "tree models" specify different biological hypotheses testable via LRTs. Each "branch model" differs according to the branch, or branches, that are identified with a "branch mark" (i.e., #1, #2, etc.) as having unique selection pressure (d_N/d_S).

```

* tree.H0.txt (H0 in Table 3):
